

Lab 2

14/8/18

Create a class named 'Box' with three data members- length, breadth and height and a method to calculate the volume which is 'length*breadth*height'. The class has three constructors which are :

- 1 - Having no parameter - values of both length, breadth and height are assigned zero.
- 2 - Having three numbers as parameters - the three numbers are assigned as length, breadth and height respectively.
- 3 - Having one number as parameter - all length, breadth and height are assigned that number.

Now, create objects of the 'Box' class having none, one and three parameters and print their volume.
